Evidence Based Medicine

- Li L, Bombardier C. Utilization of physiotherapy and occupational therapy by Ontario rheumatologists in managing rheumatoid arthritis: a survey. *Physiother Can* 2003 Winter; 55(1):23-30.
- Kennedy N. Keogan F. Fitzpatrick M. Cussen G. Wallace L. **Characteristics of patients with rheumatoid arthritis presenting for physiotherapy management: a multicentre study.** *Musculoskeletal Care* 2007; 5(1):20-5.
- Martin LJ. Griffith SM. **High disease activity scores predict the need for additional health services in patients over 60 with rheumatoid arthritis.** *Musculoskel. Care.* 2006;4(1):1-11.
- Iversen MD et al **How Rheumatologists and Patients With Rheumatoid Arthritis Discuss Exercise and the Influence of Discussions on Exercise Prescriptions** *Arthritis & Rheumatism (Arthritis Care & Research)* 2004;51(1); 63–72.

Impact of Rheumatoid Arthritis

- The estimated annual cost of RA in United States is over 8.7 billion dollars (Ramsburg KL 2000)
- Patients with RA are 8x more likely to have functional disability as compared to adults in general populations of same community. (Sokka, T et al. 2003)
- 30% patients with RA have permanent work disability within first 3 yrs of diagnosis (Sokka, T. 2003)

Physical Therapy (PT) and RA

- PT is recommended by the ACR, EULAR and professional societies to manage symptoms of RA
 - Use of PT services leads to significant improvements in self-efficacy, pain & disease activity ($p < 0.01$) (Lineker 2001)
 - PT plays an integral role in helping patients cope with chronic pain and disability (Matsuta, K; Kikuna, T. 1992; Lineker 2001; Newsome 2002)
 - Increased ability to perform ADLs (Newsome 2002) thereby, reducing disability

Use of Physical Therapy in Rheumatoid Arthritis

Although physical therapy (PT) is proven to be effective, it is underutilized

- In Ontario 26.5% of rheumatologists refer patients to PT (Li et al 2003)
- Cross sectional study of outpatients, 22.5% of RA patients had unmet demands for PT (Martin 2006)
- A US study reported rheumatologists referred only 26.5% patients to PT (Iversen et al. 2005)
- In Germany, 44% of RA patients received individual PT (Zink et al. 2001)

Purpose and Design

■ Purpose:

- To identify factors associated with use of Physical Therapy services among patients with Rheumatoid Arthritis

■ Design:

- Design: Secondary analysis of a large prospective cohort

Subjects

- 1032 patients enrolled in the BRASS Registry at Brigham and Women's Hospital (BWH)

- Inclusion criteria:

- Patients aged ≥ 18 years and diagnosed with RA or seronegative inflammatory arthritis (ICD-9 codes)
- Meets American College of Rheumatology criteria for RA
- Completed 12 month follow up survey

- Exclusion criteria:

- Patients diagnosed as Psoriasis or SLE
- Patients <18 yrs

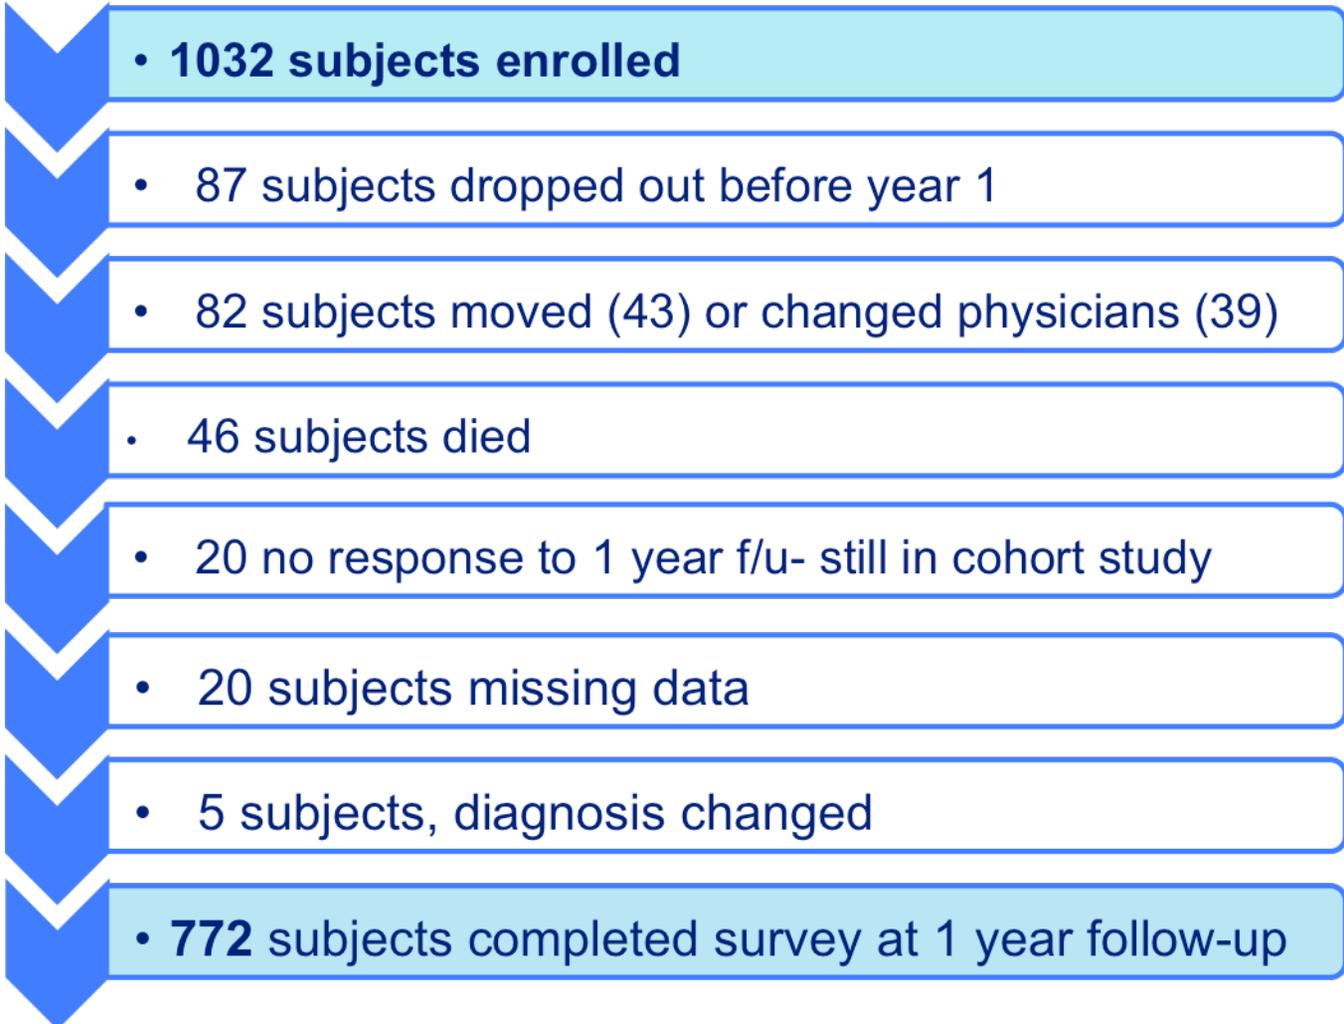

Measures

Variables	Measures
Demographic features	Age, gender, education, income, race, insurance, employment, marital/living arrangement status
Medical history	Number of Co-morbidities, RA medications, duration of RA symptoms
Self-efficacy	Arthritis self efficacy scale (Lorig et al.1998)
Disability	MDHAQ (Pincus et al. 1999)
Disease activity	RADAI (Stucki et al 1995)
Social networks	Berkman Syme Social Network Index (Berkman S. 1979)
Fatigue	MDHAQ Fatigue (Pincus et al. 1999)
Physical activity	Previous h/o exercise

Analyses

- Outcome: Use of Physical Therapy (y/n)
 - Descriptive statistics to characterize sample
 - T-tests, Chi Squared, Wilcoxon Rank Sum tests to examine differences between those who completed and those who dropped out
 - Univariate comparison of independent variables with outcome
 - Variables grouped and entered into logistic regression model to determine most significant predictor in group
 - Final multivariate logistic regression

Recruitment Results

- **1032 subjects enrolled**

- 87 subjects dropped out before year 1

- 82 subjects moved (43) or changed physicians (39)

- 46 subjects died

- 20 no response to 1 year f/u- still in cohort study

- 20 subjects missing data

- 5 subjects, diagnosis changed

- **772 subjects completed survey at 1 year follow-up**

Features of Patients Who Completed the Follow-up and Those Who Did Not (n=1032)

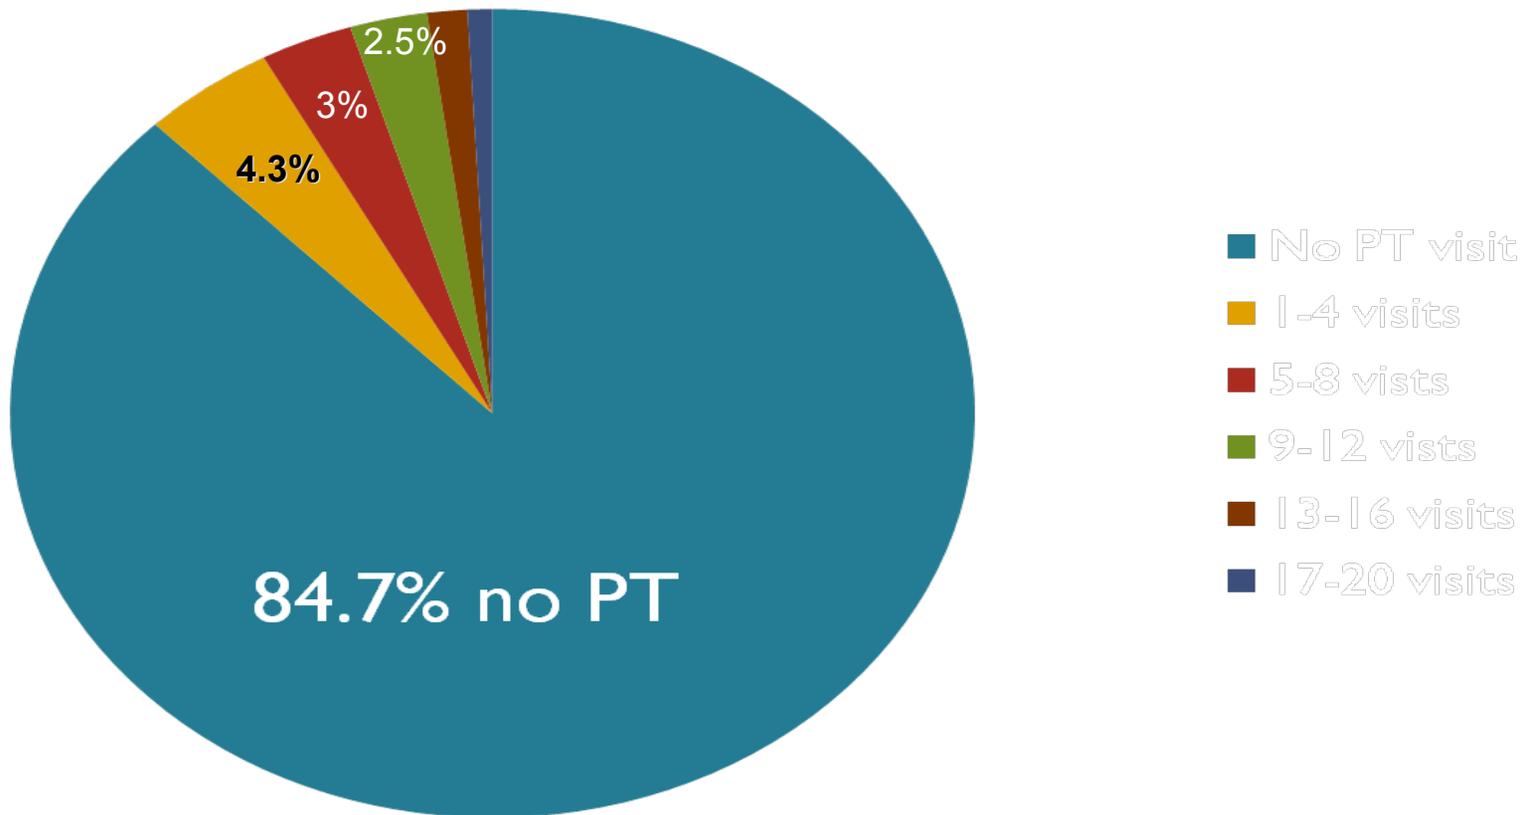

Baseline Variables	Completed f/u (n=772)	Did Not Complete (n=260)	P-value
Mean Age (yrs)	56.3 (±13.6)	56.2 (±15.5)	NS
Female	642 (83.2%)	208 (80%)	NS
College Graduates	171 (22.2%)	63 (24.9%)	NS
Income (\$70k-\$90k)	330 (50.3%)	89 (45.3%)	NS
Caucasian	719 (93.6%)	251 (96.8%)	NS
Married	498 (64.7%)	164 (63.1%)	NS
Disability	71 (9.8%)	25 (10.7%)	NS
Co-morbidities	1.8 (± 1.30)	1.6 (± 1.26)	NS
RA diagnosis < 2 yrs	155 (20.1)	63 (24.2)	NS
Previous h/o exercise	209 (27.1%)	65 (25%)	NS

Health and Psychosocial Status Of Those Who Completed and Those Who Did Not (n=1032)

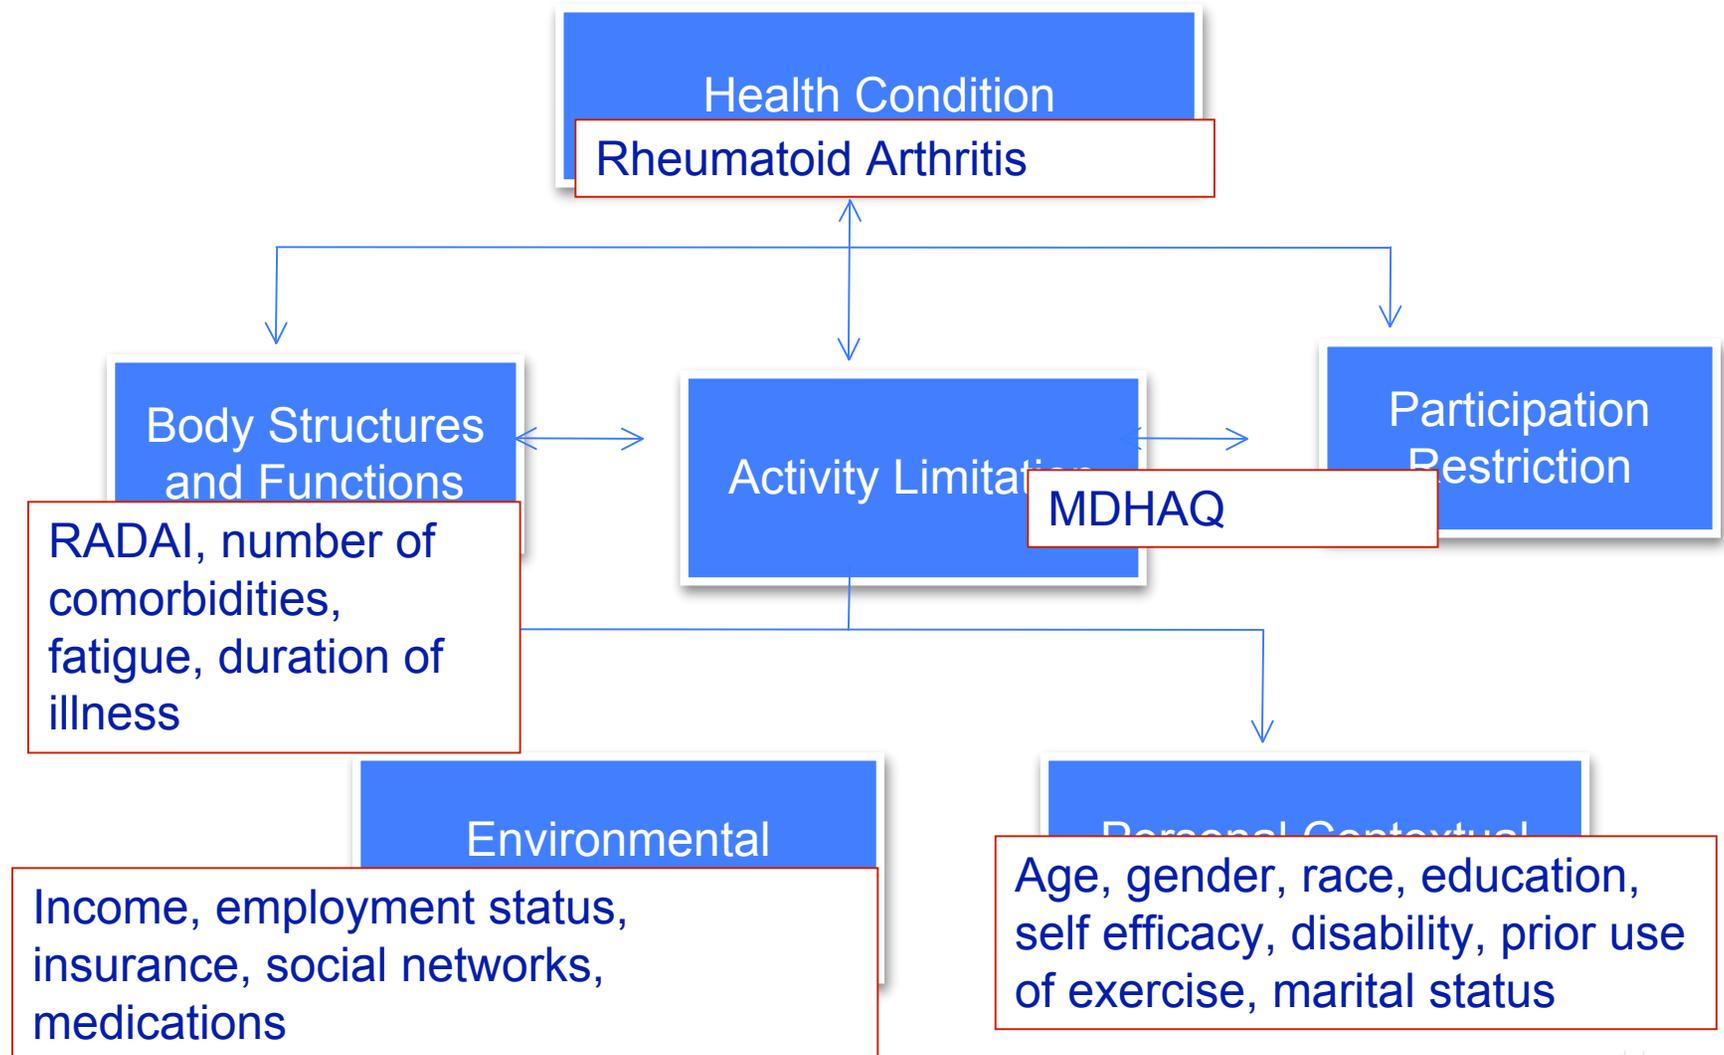

Baseline variables	Completed (N=772)	Did Not Complete (N=260)	P-value
Median MDHAQ (range)	0.63 (0-3)	0.6 (0-3)	NS
Median Self efficacy (range)	75 (10-100)	70 (10-100)	NS
Disease Activity (RADAI) :			NS
Mild (<=3.1)	354 (45.8%)	105 (40.4%)	
Moderate (3.1 to <=5.1)	184 (23.8%)	55 (21.2%)	
Highly active	234 (30.3%)	100 (38.4%)	
Mean Fatigue (SD)	42.18 (± 28.78)	42.5 (± 29.1)	NS
Social network scale			NS
Level I	100 (14.9%)	44 (17%)	
Level II	286(42.6%)	104 (40%)	
Level III	148 (22.0%)	65 (25%)	
Level IV	138 (20.5%)	47 (18%)	

Number of PT Visits per Subject

Use of Physical Therapy services

Variables Grouped Based on International Classification of Function (ICF)

Univariate Relationships with Primary Outcome- PT Use (Y/N)

	Odds Ratio (95%CI)
Age (< 60 yrs vs 60+)	1.0 (0.7 – 1.6)
Female	1.2 (0.7 – 2.0)
Education	2.2 (1.2 - 3.8)
On DMARDs, biologics, steroids	1.9 (0.8 – 4.4)
Unemployed on Disability	2.4 (1.4 – 4.3)
Health Insurance	0.4 (0.1 - 1.6)
Married or Living with Partner	0.8 (0.6 – 1.2)
Caucasian	0.9 (0.3 – 3.1)
Exerciser	1.8 (1.1 – 2.9)
Income (< 70 k versus >= 70 K)	0.5 (0.3 – 0.8)

Bivariate Relationships with Primary Outcome- Use of PT

	Odds Ratio (95% CI)
Disease Activity	1.2 (1.1 – 1.3)
Disease Duration (≥ 2 yrs vs < 2 yrs)	1.4 (0.8 – 2.3)
Fatigue	1.2 (0.8 – 1.9)
Disability (MDHAQ ≥ 1 vs < 1)	1.7 (1.1 – 2.7)
Arthritis self-efficacy	1.2 (0.8 – 1.8)
Co-morbidities	1.1 (1.03 – 1.4)
Social Networks (Berkman Syme Index)	1.07 (1.02 – 1.3)

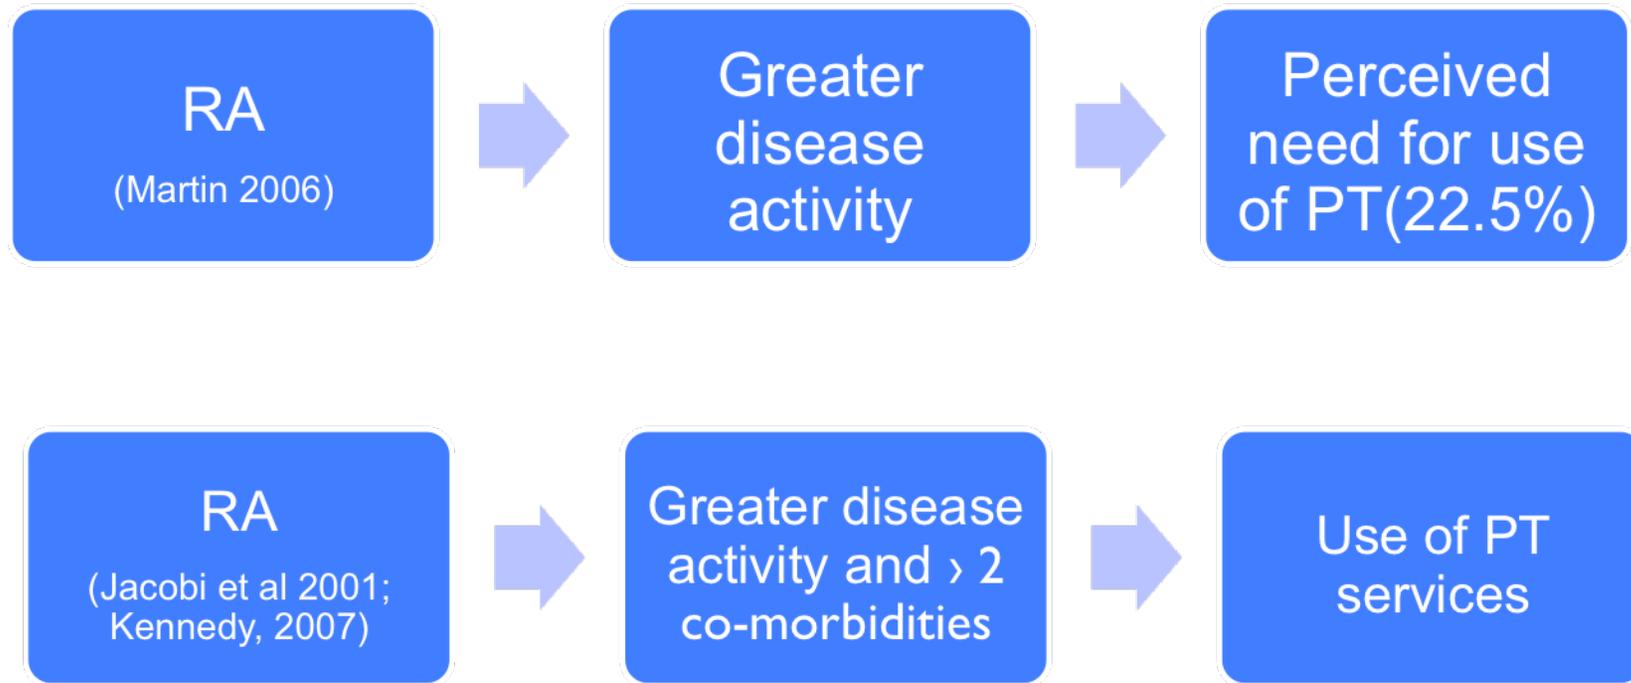

Predictors of Physical Therapy Use in Persons with RA (n=671)

Predictors	Odds Ratio	95% CI
<i>Body Structures and Function</i>		
Disease Activity (RADAI)	1.4	1.1 – 1.8
<i>Contextual factors</i>		
Unemployed on Disability	2.4	1.3 - 4.6
Education	1.5	1.2 - 1.9
Social Networks (BSNI)	2.1	1.3 – 3.5

Discussion

- Our patients were primarily Caucasian females who had a high income, were well educated and had strong social networks
- 15.3% of the sample received PT services – slightly lower than the prior reports (Li et al 2003, Martin J 2006, Zink et al. 2001, Iversen et al 2005)
- ICF framework was useful in identifying contextual factors associated with PT use. (Cieza A, Stucki G 2005)

Discussion: Disease activity and Use of PT Services

Discussion

- Greater social networks associated with:
 - lower mortality (Berkman, 1979; Giles,2009)
 - provide access to care (Berkman, 1979)
 - motivation and information/advice about health services (Lubben et al 1988)
- Patients with higher education, even among well educated persons, were 50% more likely to use PT services
- Income was not significant after adjusting for social support and education

Discussion

- While fatigue has been identified as a predictor of PT service use (Waltz ,2000), disease activity was a stronger predictor
- Physical disability has been shown to predict referrals for PT (Waltz M 2000)
 - Disability, as measured by HAQ, was found to be significant predictor for utilization of PT services (Jacobi et al 2001) but was not significant in the multivariable model

Limitations

- Our sample was not culturally and SES diverse, so the results of this study cannot be generalized to all patients with RA
- While the study captured information on many known attributes associated with PT service use, it did not capture all potential attributes.

Strengths

- Used a combination of demographic, health, psychological and clinical factors to identify predictors of PT service use
- Large sample
- Used theoretical framework (ICF) for model building
- Limited missing data

Conclusion

- Patients with greater disease activity and disability and who are well educated with strong social networks were more likely to receive PT services.
- This study helps to identify new contextual factors associated with PT service use
